

## Hidden buried anti-theft system

Everyone usually strolls through supermarkets, shopping for clothes and bags, large shopping malls, and then we will observe that there are two "door gods" at the outlet of the store. Most people know that it is anti-theft alarm equipment, also known as anti-theft antenna. It gives people the feeling of a robot policeman. You haven't done anything wrong. It's naturally very reassuring to see it. It's over, but if you do something wrong, you're afraid that it will "alarm" you!

The main function of anti-theft equipment is that when items with anti-theft labels (hard tags and soft labels) pass through the anti-theft antenna, the antenna will automatically alarm and play a role of anti-damage. However, in some supermarkets, shopping malls and clothing stores, only valuable items are often equipped with anti-theft labels, and more items can not be fully installed, and the cost is often too high. So when these items are stolen, even if there are anti-theft alarm devices, they can not catch them, because they all know that no anti-theft alarm will not ring. Over time, these people will steal more.

Are these theft issues effectively avoided?

Today, Xiaobian will introduce a high-tech anti-theft system: buried anti-theft equipment, first show you the installation

Are you very doubtful that the anti-theft antenna is not on the ground but in the ground?

This is the difference between buried anti-theft equipment and vertical anti-theft equipment. The antenna is completely hidden under the floor, which

will not affect the beautiful appearance of the store, while maintaining high-quality anti-theft performance of goods. The most important thing is that it can help businessmen catch a lot of theft, and the power of "door god" will be greatly increased!!

Because it's underground, some people will think that stores don't have anti-theft alarm equipment, and the thought of theft can be manifested openly and impartially. When businesses selectively install small and hidden anti-theft labels in their goods, buried anti-theft equipment will immediately alarm and catch the thieves when the thieves go out of the exit after theft. So give those who have a big warning!!!

1. Fully concealed installation under the floor will not affect the beauty of the store, improve the utilization of space, and the antenna buried underground will provide wide export protection will not affect passenger traffic.
2. Good stability, DSP processing chip, selected high-quality components, more reliable and stable work, strong anti-interference ability, low false alarm rate, false alarm rate.
3. Suitable for installation of various flooring materials, wood flooring, concrete flooring or other flooring.
4. The installation method is flexible and diversified. It can be installed in simple concrete layer with cable, cement ground and raised ground.
- 5, a single transmitter and receiver can protect the export of 2 meters wide, and protect the height of 1.2-1.6 meters (according to the label type).
6. Installation of up to 8 single doors, detection width of 16 meters, ultra-wide spacing allows users to decorate more freely.
7. Automatic self-adaptive, self-detection technology, automatic gain control technology, effectively identify, filter and suppress external environmental interference, achieve the ideal effect of high alarm and no false alarm.
8. Complying with the relevant radio frequency, signal strength and electromagnetic issued by the Federal Communications Commission (FCC).

**But it also has a trouble, that is, to install in the shop decoration, if the shop has been decorated, it is not suitable for installing buried antenna, the amount of work is large, and it is not conducive to the normal operation of the shop, so those who want to install buried anti-theft equipment should know and book in advance to avoid installing it. Unfortunately it can't be installed.**
